GROW BAGS EASY PLANTERS

Why to use coir fiber?

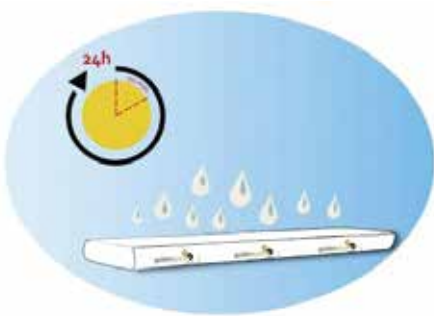

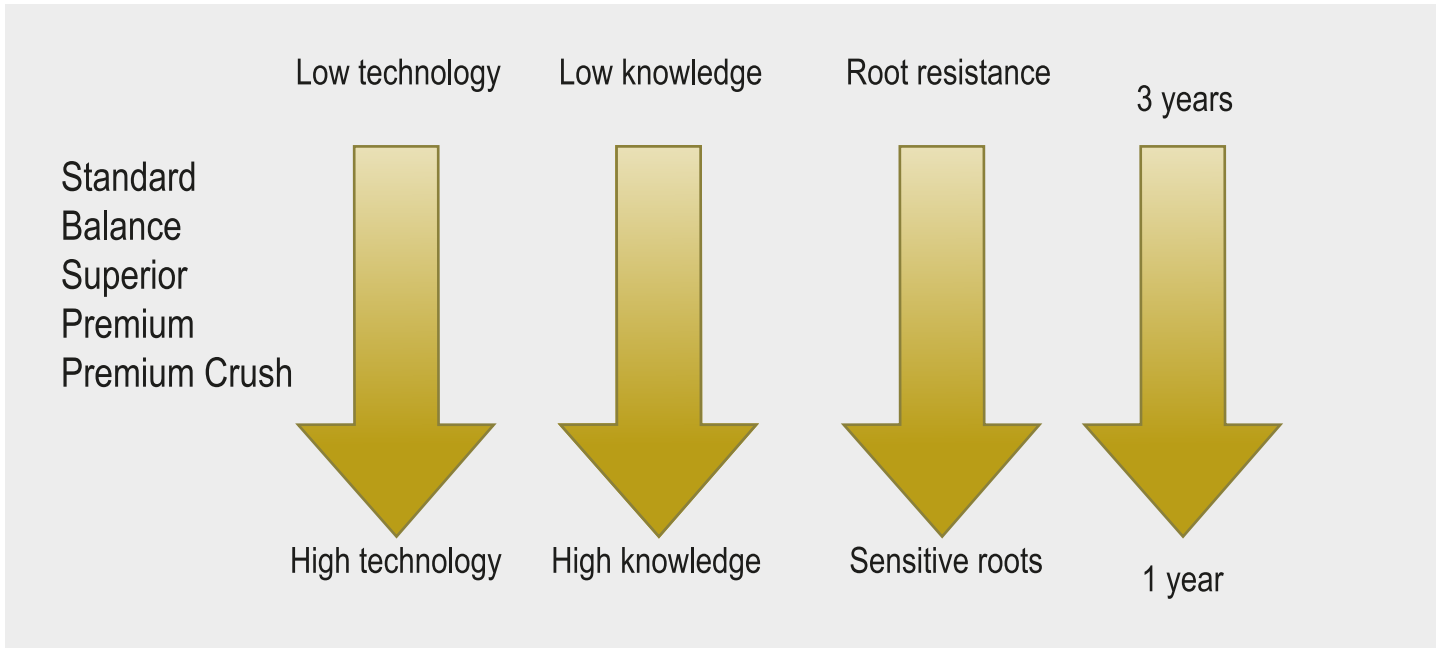

Coco coir is an excellent substrate for multiple applications, both by itself and in combination with other materials, and is greatly beneficial for plant root development.

- Golden Grow coco coir is lightweight and easy to handle.
- Its high porosity combined with its high water retention promotes great root development.
- It has a water retention capacity of about 9 times its weight.
- pH suitable for the vast majority of species (5.5-6.5).
- It does not compact and allows easy rehydration for a quick recovery of its structure.
- Its soluble salt content is easily washed out to reach suitable electrical conductivity levels for plant development. (Can also be provided pre-washed.)
- Free of seeds, diseases and pesticides.
- OMRI certificate.

What composition should we choose?
